CTD OBSERVATIONS ON THE NORTH BRAZIL SHELF DURING  
A MULTIDISCIPLINARY AMAZON SHELF SEDIMENT STUDY, AMASSEDS,  
AUGUST 1989

**Abstract**

CTD and acoustic Doppler current profiler (ADCP) observations were made on the North Brazil shelf adjacent to the mouth of the Amazon River during R/V *Iselin* cruise I8909 August 3-14, 1989 as part of A Multidisciplinary Amazon Shelf SEDiment Study (AMASSEDS). These observations were obtained during a large-scale survey in support of geological and geochemical sampling, an anchored time series station consisting of 26 hourly CTD casts, and one transect which was repeated off the mouth of the Amazon River. The maximum sampling depth at each station was within two meters of the bottom.

The primary objectives of the AMASSEDS hydrographic measurement program were to (a) observe and characterize the temperature, salinity, density, oxygen, fluorescence and light transmission fields and their spatial variability on the north Brazilian shelf directly influenced by the Amazon River discharge, (b) resolve the seaward extent and vertical structure of the surface plume of low salinity Amazon River water during different stages of river discharge, (c) describe the spatial structure of the turbidity and associated suspended sediment distributions across the shelf, (d) characterize the properties of the Amazon shelf water beneath the surface plume and their seasonal variability, and (e) describe the landward penetration of the North Brazil Current (NBC) with respect to water properties and shelf currents. This report represents a summary in graphic and tabular form of the hydrographic observations made during the first AMASSEDS cruise (I8909) on the R/V *Iselin*.

## 1. Introduction

A Multidisciplinary Amazon Shelf SEDiment Study (AMASSEDS) is an multi-institutional international program to investigate physical, geological, geochemical and biological processes within the Amazon dispersal system. The primary objective of AMASSEDS is to understand the sedimentary processes on the continental shelf near the mouth of the Amazon River. Previous studies of the Amazon shelf and similar environments suggest that the enormous suspended sediment load carried over the inner shelf in the local water column strongly influences other factors such as seabed morphology and biological productivity, and leads to creation of a subaqueous delta. The physical oceanographic component of AMASSEDS is directed toward understanding circulation and boundary layer processes on the Amazon shelf. The primary objectives are to (a) measure and characterize the flow and mixing processes in the low salinity frontal zone, (b) to estimate the contributions to bottom stress from subtidal motions, tidal flow, and surface waves, and (c) to quantify the cross-shelf advective and dispersive transport mechanisms. The physical oceanographic field work includes: short-term (February – May, 1990) moored measurements of wind, current, temperature, conductivity, and surface waves to determine tidal and low-frequency variability in the shelf flow field, density stratification, and surface and bottom stresses; a series of four hydrographic surveys to map the distributions of temperature, salinity, and turbidity during different stages of river discharge; and short-term high resolution measurements of the small-scale circulation and mixing processes in the frontal zone. Satellite imagery of the sea surface is being collected to describe the synoptic distribution of suspended sediment. Finally, two satellite-tracked drifting buoys are being deployed on each of the four hydrographic surveys. The first survey August, 1989 was completed during falling river discharge; the second survey is planned for February, 1990 during rising river discharge; the third survey is planned for May, 1990 during maximum river discharge, and the fourth and last cruise is planned during November, 1991 during low river discharge. These measurements include hydrographic and current profiling with a CTD and a 600 kHz acoustic Doppler current profiler (ADCP), respectively.

We present here in graphic and tabular form a preliminary analysis of the CTD observations made on the North Brazil shelf on board the R/V *Iselin* during cruise I8909 August 3 – 14, 1989. A total of 86 CTD stations were made on I8909, and the following station summary is intended to provide a brief description of the sequence of CTD sampling during the cruise. Vertical and horizontal sections of water properties

obtained from the regional CTD survey August 3 – 14 are shown in Section 7. Listings of the CTD observations at standard depths for all stations are given in Section 8.

## CTD STATION LISTING SUMMARY

Leg 1 — August 3–14, 1989

Stations 1–52 — August 4–10. Initial large-scale survey of the North Brazil shelf consisting of 7 cross-shelf transects to map the initial fields of temperature, salinity, sigma-t, oxygen, fluorescence, and light transmission.

Station 53 — August 10. CTD cast made just after deployment of a pilot mooring to test depth penetration of the anchor into the sediments.

Stations 54–79 — August 11–12. 26 hour time series anchor station consisting of hourly CTD casts.

Stations 81–86 — August 12–13. Repeat of Section C adjacent to the mouth of the Amazon River.

## 2. Instrumentation and Calibration

A Neil Brown Instrument Systems (NBIS) model MKIII CTD fish was used as the primary profiling instrument during R/V *Iselin* cruise I8909. The instrument provided continuous sampling of temperature, conductivity, pressure, and light transmission. Salinity and density were subsequently derived from the measured variables. The oxygen and fluorescence sensors on the underwater unit did not work properly during the entire cruise. The instrument package consisted of the MKIII CTD underwater unit mounted one meter below a General Oceanics rosette sampler with 12 five-liter Niskin bottles. A Sea Tech 5 cm pathlength transmissometer was mounted near the CTD fish. The fast response thermistor on the CTD fish was disabled and the instrument sampled at a rate of 16 Hz. Lowering speeds were approximately 36 m/min to match the response times of the temperature and conductivity sensors (Giles and McDougall, 1986). The pressure sensor had a full range of 6400 db.

The CTD underwater unit was part of the R/V *Iselin*'s scientific equipment. Water samples were normally collected at each station on the up cast at a depth where the vertical stratification and suspended sediment concentration were minimal. The calibration samples were then processed onboard during the cruise using a Guildline AutoSal salinometer to determine salinity. The individual salinities were converted to *in situ* conductivity and compared to the conductivity output of the instrument. A least-squares fit of the difference between the bottle and instrument conductivity gives

$$C(BOTTLE) - C(CTD) = -0.0000349498 * X - 0.0176786$$

where  $X$  is the station number which varied from 1 to 86, and the sum of the squares of the residuals is  $0.0121 \text{ mmho}^2$ . This means that the CTD conductivity sensor drift and offset were small during the cruise and that the rms difference between the corrected CTD and bottle conductivity values was  $\pm 0.004 \text{ mmho}$ .

The Sea Tech transmissometer data is presented as a percent of full scale. The primary light transmission sensor (channel b) functioned intermittently at stations 24 – 29. At station 30 a secondary 5 cm pathlength transmissionmeter was installed on channel b, and the primary sensor was placed on channel a for observation and testing. Stations 24–29 were located in relatively clear water and a linear interpolation was made for all bad light transmission data.

### 3. Data Processing

The CTD data were recorded at sea with a PC-based data acquisition system written by Howard Saklad of the University of Alaska, Institute of Marine Science. The program acquires the raw CTD data at 16 Hz, displays the data in real time, postcast data averages, and prints lists of data at each station. Normally, only the down profile is processed at sea. During post cruise data processing, the conductivity calibration was first applied to the raw data. Then an exponential recursive filter (Middleton and Foster, 1980) described by Cox was applied to pressure and conductivity to match the amplitude and phase of the platinum temperature sensor. The Cox filter has the form

$$c'(t) = w_0 c'(t - dt) + (1 - w_0) c(t),$$

where  $c'(t)$  is the filtered conductivity at time  $t$ ,  $c'(t - dt)$  is the previous filtered conductivity, and  $c(t)$  is the original unfiltered conductivity at time  $t$ . The filter weight is given by

$$w_0 = e^{-dt/tlag}$$

where  $dt = .064$  sec is the sampling period, and  $tlag = .235$  sec is the time lag of the platinum temperature sensor. A uniform pressure series of 1 db interval was then created from the filtered data, after spurious data observations (spikes) had been replaced with interpolated data. Salinity was calculated using Lewis (1980) and a value of 42.914 was used to convert to conductivity ratio (Culkin and Smith, 1980).

#### 4. Data Presentation

The hydrographic data collected on cruise I8909 are shown in the form of vertical sections, T/S correlations and horizontal sections in Section 7, and vertical profiles and tabular lists at graduated depths are given in Section 8.

#### 5. Acknowledgments

Cruise I8909 on the R/V *Iselin* was supported by NSF Grant OCE88-12917. Dr. David Demaster was the Chief Scientist on the multidisciplinary cruise. The work was a cooperative effort by R. Limeburner, Y. Yu, R. Johnson, T. Milligan, R. Pope, D. Demaster, S. Hardin, I. Dias, J. Faleiro, J. Neto, H. Vital and D. Muehe. Their assistance is greatly appreciated. Finally, the helpfulness of the officers and crew of the R/V *Iselin* contributed significantly to the success of the cruise.

<b>16. Abstract (Limit: 200 words)</b> CTD and acoustic Doppler current profiler (ADCP) observations were made on the North Brazil shelf adjacent to the mouth of the Amazon River during R/V <i>Iselin</i> cruise I8909 August 3-14, 1989 as part of A Multidisciplinary Amazon Shelf SEDiment Study (AMASSEDS). These observations were obtained during a large-scale survey in support of geological and geochemical sampling, an anchored time series station consisting of 26 hourly CTD casts, and one transect which was repeated off the mouth of the Amazon River. The maximum sampling depth at each station was within two meters of the bottom.  The primary objectives of the AMASSEDS hydrographic measurement program were to (a) observe and characterize the temperature, salinity, density, oxygen, fluorescence and light transmission fields and their spatial variability on the north Brazilian shelf directly influenced by the Amazon River discharge, (b) resolve the seaward extent and vertical structure of the surface plume of low salinity Amazon River water during different stages of river discharge, (c) describe the spatial structure of the turbidity and associated suspended sediment distributions across the shelf, (d) characterize the properties of the Amazon shelf water beneath the surface plume and their seasonal variability, and (e) describe the landward penetration of the North Brazil Current (NBC) with respect to water properties and shelf currents. This report represents a summary in graphic and tabular form of the hydrographic observations made during the first AMASSEDS cruise (I8909) on the R/V <i>Iselin</i> .
